| TABLE 2: TERMS AND ABBREVIATIONS | 46 |

## 1 Introduction

Quectel LTE Standard modules feature embedded TCP/IP stack, which enables the host to access the Internet directly via AT commands. This greatly reduces the dependence on external PPP and TCP/IP protocol stacks and thus minimizes the cost. LTE Standard modules provide the following socket services: TCP client, UDP client, TCP server and UDP server.

This document is applicable to following LTE Standard modules.

EC2x: EC25, EC21, EC20 R2.0 and EC20 R2.1

• EG2x-G: EG25-G and EG21-G

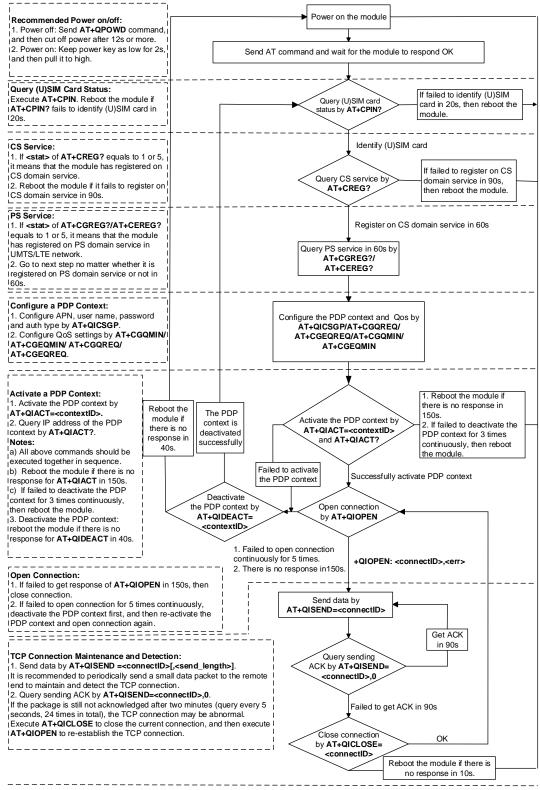

• EG9x: EG91 and EG95

EM05

#### 1.1. The Process of Using TCP/IP AT Commands

Through TCP/IP AT commands, the host can configure a PDP context, activate/deactivate the PDP context, start/close socket service and send/receive data via socket service. The following figure illustrates how to use TCP/IP AT commands.

#### Notes

- 1. Please note that users need to wait for the final response (for example "OK", "CME ERROR", "CMS ERROR") of the last AT command you entered before you enter the part AT command. You can report the module if the module falls to get response in 60s.
- entered before you enter the next AT command. You can reboot the module if the module fails to get response in 60s.

  2. Reboot the module if the module has not got response of **AT+QIACT** in 150s or response of **AT+QICLOSE** in 10s and in 40s
- 3. It is NOT recommended to frequently reboot the module. When the module has been continuously rebooted for 3 times due to failed AT command execution, it can be rebooted immediately for the first time after that. If it still fails, reboot the module after 10 minutes for the second time, and reboot after 30 minutes for the third time, one hour for the fourth time, etc.

Figure 1: Flow Chart of Using TCP/IP AT Commands

#### 1.2. Description of Data Access Modes

LTE Standard modules support the following three kinds of data access modes:

- Buffer access mode
- Direct push mode
- Transparent access mode

When opening a socket service via **AT+QIOPEN**, the data access mode can be specified by the parameter **<access\_mode>**. After a socket service is opened, customers can switch the access mode via **AT+QISWTMD**.

- In buffer access mode, data can be sent via AT+QISEND command, and if the module has received the data from the Internet, it will buffer the data and report a URC as +QIURC: "recv",<connectID>.
   Data can be read via AT+QIRD command.
- In direct push mode, data can be sent via AT+QISEND command, and if the module has received the
  data from the Internet, the data will be outputted to COM port directly in the following format:
  +QIURC: "recv",<connectID>,<currectrecvlength><CR><LF><data>.
- 3. In transparent access mode, the corresponding port (such as UART, USB modem port, etc.) enters into the exclusive mode. The data received from COM port will be sent to the Internet directly, and the data received from Internet will be outputted via COM port directly. +++ can be used to exit from transparent access mode. When OK is returned, the module will be switched to buffer access mode. AT+QISWTMD can be used to switch the data access mode back to transparent access mode.

#### • Exit from transparent access mode

To exit from the transparent access mode, +++ or DTR (AT&D1 should be set first) can be used. To prevent the +++ from being misinterpreted as data, the following sequence should be followed:

- 1) Do not input any character within 1s or longer before inputting +++.
- 2) Input +++ within 1s, and no other characters can be inputted during the time.
- 3) Do not input any character within 1s after +++ has been inputted.
- 4) Use +++ or DTR (AT&D1 should be set first) to make the module exit from transparent access mode, and wait until **OK** is returned.

#### Return back to transparent access mode

- 1) By AT+QISWTMD. Specify the <access\_mode> as 2 when executing this command. When transparent access mode has been entered successfully, CONNECT will be returned.
- 2) By ATO. After a connection exits from transparent access mode, executing ATO will switch the data access mode back to transparent access mode again. When transparent access mode has been entered successfully, CONNECT will be returned. If no connection has entered transparent access mode before, ATO will return NO CARRIER.

#### **NOTES**

- 1. In buffer access mode, if the buffer is not empty, the module will not report a new URC until all the received data has been read via **AT+QIRD** from the buffer.
- In transparent access mode, AT commands cannot be executed. If the socket connection is closed because of network error or other errors, the module will report NO CARRIER and exit from the transparent access mode. In this case, AT+QICLOSE should be executed to close the socket service.

# 2 Description of TCP/IP AT Commands

#### 2.1. Description of AT Commands

#### 2.1.1. AT+QICSGP Configure Parameters of a TCP/IP Context

The command can be used to configure the **<APN>**, **<username>**, **<password>** and other parameters of a TCP/IP context. The QoS settings can be configured by **AT+CGQMIN**, **AT+CGEQMIN**, **AT+CGEQMIN**, **AT+CGEQREQ** and **AT+CGEQREQ**.

| AT+QICSGP Configure Parameter  | rs of a TCP/IP Context  |
|--|---|
| Test Command AT+QICSGP=?   | Response<br>+QICSGP: (1-16),(1-3), <apn>,<username>,<password>,<br/>(0-3),(0-1)</password></username></apn>                                     |
| WriteCommand  Query the configuration of a specified context  AT+QICSGP= <contextid></contextid>   | Response +QICSGP: <context_type>,<apn>,<username>,<passwor d="">,<authentication> OK</authentication></passwor></username></apn></context_type> |
| Write Command Configure the context AT+QICSGP= <contextid>[,<context_t ype="">,<apn>[,<username>,<password>)[,<authentication>[,<cdma_pwd>]]]]</cdma_pwd></authentication></password></username></apn></context_t></contextid> | Response OK  If there is any error: ERROR   |

#### **Parameter**

| <contextid></contextid>       | Integer type. The context ID. The range is 1-16.            |
|-------------------------------|---|
| <context_type></context_type> | Integer type. The protocol type.                            |
|                               | <u>1</u> IPv4   |
|                               | 2 IPv6  |
|                               | 3 IPv4v6  |
| <apn></apn>                   | String type. The access point name.                         |
| <username></username>         | String type. The username. The maximum length is 127 bytes. |

|                                   | 0.1      |   |
|-----------------------------------|----------|---|
| <password></password>             | Strin    | g type. The password. The maximum length is 127 bytes.  |
| <authentication></authentication> | Integ    | ger type. The authentication methods.   |
|                                   | 0        | None  |
|                                   | 1        | PAP   |
|                                   | 2        | CHAP  |
|                                   | 3        | PAP or CHAP   |
| <cdma_pwd></cdma_pwd>             | Integ    | ger type. To configure whether to save <b><username></username></b> and <b><password></password></b> over |
|                                   | CDM      | 1A network.   |
|                                   | <u>0</u> | Disable   |
|                                   | 1        | Enable  |

#### **Example**

```
AT+QICSGP=1 //Query the configuration of context 1.
+QICSGP: 1,"","","0

OK
AT+QICSGP=1,1,"UNINET","","1 //Configure context 1. APN is "UNINET" for China Unicom.
OK
```

#### 2.1.2. AT+QIACT Activate a PDP Context

Before activating a PDP context via **AT+QIACT**, the context should be configured by **AT+QICSGP**. After activation, the IP address can be queried via **AT+QIACT**?.

Although the range of **<contextID>** is 1-16, the module supports maximum three PDP contexts activated simultaneously. Depending on the network, it may take at most 150 seconds to return **OK** or **ERROR** after executing **AT+QIACT**. Before the response is returned, other AT commands cannot be executed.

| AT+QIACT Activate a PDP Conte | xt   |
|-------------------------------|--|
| Test Command AT+QIACT=?       | Response +QIACT: (1-16)  |
|                               | ок   |
| Read command AT+QIACT?        | Response Return the list of the currently activated contexts and their IP addresses: +QIACT: 1, <context_state>,<context_type>[,<ip_addresses]< td=""></ip_addresses]<></context_type></context_state> |
|                               |  |

|                                   | ОК                                      |
|-----------------------------------|---|
| Write Command                     | Response                                |
| Activate a specified PDP context  | Activate the specified context:         |
| AT+QIACT= <contextid></contextid> | ОК                                      |
|                                   |   |
|                                   | If there is any error:                  |
|                                   | ERROR                                   |
| Maximum Response Time             | 150 seconds, determined by the network. |

| <contextid></contextid>         | Integer type. The context ID. The range is 1-16.     |
|---------------------------------|--|
| <context_state></context_state> | Integer type. The context state.                     |
|                                 | 0 Deactivated  |
|                                 | 1 Activated  |
| <context_type></context_type>   | Integer type. The protocol type.                     |
|                                 | <u>1</u> IPv4  |
|                                 | 2 IPv6   |
|                                 | 3 IPv4v6   |
| <ip_address></ip_address>       | The local IP address after the context is activated. |

#### 2.1.3. AT+QIDEACT Deactivate a PDP Context

The command is used to deactivate a specific context and close all TCP/IP connections set up in this context. Depending on the network, it may take at most 40 seconds to return **OK** or **ERROR** after executing **AT+QIDEACT**. Before the response is returned, other AT commands cannot be executed.

| AT+QIDEACT Deactivate a PDP C       | Sontext                             |
|-------------------------------------|-------------------------------------|
| Test Command AT+QIDEACT=?           | Response +QIDEACT: (1-16)           |
|                                     | ОК                                  |
| Write Command                       | Response                            |
| AT+QIDEACT= <contextid></contextid> | ОК                                  |
|                                     | If there is any error:              |
|                                     | ERROR                               |
| Maximum Response Time               | 40 seconds, determined the network. |

| ntextID> Integer type. The context ID. The range is 1-16. |
|---|
|---|

#### 2.1.4. AT+QIOPEN Open a Socket Service

The command is used to open a socket service. The service type can be specified by **<service\_type>** parameter. The data access mode (buffer access mode, direct push mode and transparent access mode) can be specified by **<access\_mode>** parameter. The URC **+QIOPEN** indicates whether the socket service has been opened successfully.

- If <service\_type> is "TCP LISTENER", the module works as TCP server. After accepting a new TCP connection, the module will automatically specify a <connectID> and report a URC as +QIURC: "incoming",<connectID>,<serverID>,<remoteIP>,<remote\_port>. The range of <connectID> is 0-11. The type of this new incoming connection is "TCP INCOMING" and the <access\_mode> of "TCP INCOMING" is the same with that of "TCP LISTENER".
- 2. If <service\_type> is "UDP SERVICE", UDP data can be sent to or received from the remote IP via <local port>.
  - Send data: execute AT+QISEND=<connectID>,<send\_length>,<remotelP>,<remote\_port>.
  - Receive data in direct push mode: the module reports the URC as +QIURC:
     "recv",<connectID>,<currentrecvlength>,<remotelP>,<remote\_port><CR><LF><data>.
  - Receive data in buffer access mode: the module reports the URC as +QIURC:
     "recv",<connectID>, and then data can be retrieved via AT+QIRD=<connectID>.
- It is suggested to wait for 150 seconds for +QIOPEN: <connectID>,<err> to be outputted. If the URC cannot be received in 150 seconds after executing the Write Command, AT+QICLOSE should be used to close the socket.

| AT+QIOPEN Open a Socket Service   |   |
|---|---|
| Test Command AT+QIOPEN=?  | Response +QIOPEN: (1-16),(0-11),"TCP/UDP/TCP LISTENER/UDP SERVICE"," <ip_address>/<domain_name>",<remote_port>,<local_port>,(0-2)  OK</local_port></remote_port></domain_name></ip_address> |
| Write Command  AT+QIOPEN= <contextid>,<connectid>,<service_type>,<ip_address>/<dom ain_name="">,<remote_port>[,<local_po rt="">[,<access_mode>]]</access_mode></local_po></remote_port></dom></ip_address></service_type></connectid></contextid> | Response  If the service is in transparent access mode ( <access_mode>=2) and is opened successfully:  CONNECT  If there is any error:</access_mode>  |

|                       | ERROR  |
|-----------------------|--|
|                       | Error description can be got via AT+QIGETERROR.  |
|                       | If the service is in buffer access mode ( <access_mode>=0) or direct push mode (<access_mode>=1):  OK</access_mode></access_mode>            |
|                       | +QIOPEN: <connectid>,<err> <err> is 0 when the service is opened successfully. In other cases, <err> is not 0.</err></err></err></connectid> |
| Maximum Response Time | 150 seconds, determined by the network.  |

<contextID>

| Integer type. Socket service index. The range is 0-11.     |  |
|--|--|
| String type. Socket service type.                          |  |
| "TCP"  | Start a TCP connection as a client   |
| "UDP"  | Start a UDP connection as a client   |
| "TCP SERVICE"  | Start a TCP service.   |

Integer type. Context ID. The range is 1-16.

If **<service\_type>** is "TCP" or "UDP", the local port will be assigned automatically if **<local\_port>** is 0. Otherwise the local port is assigned as specified.

<access\_mode> Integer type. The data access mode of the socket service.

<u>0</u> Buffer access mode1 Direct push mode

specified.

2 Transparent access mode

<err> Integer type. Error codes of the operation. Please refer to *Chapter 4*.

**NOTE** 

"UDP LISTENER" of **<service\_type>** is only supported by EG95 and EG91 modules.

#### 2.1.5. AT+QICLOSE Close a Socket Service

The command is used to close a specified socket service. Depending on the network, it will take at most 10 seconds (default value, can be modified by **<timeout>**) to return **OK** or **ERROR** after executing **AT+QICLOSE**. Before the response is returned, other AT commands cannot be executed.

| AT+QICLOSE Close a Socket Service  |   |
|--|---|
| Test Command AT+QICLOSE=?  | Response<br>+QICLOSE: (0-11),(0-65535)        |
|  | ок  |
| Write Command  | Response                                      |
| AT+QICLOSE= <connectid>[,<timeout< th=""><th>If the socket service is closed successfully:</th></timeout<></connectid> | If the socket service is closed successfully: |
| >]   | OK  |
|  |   |
|  | If it is failed to close the socket service:  |
|  | ERROR   |

#### **Parameter**

| <connectid></connectid> | Integer type. The socket service index. The range is 0-11.                                    |
|-------------------------|---|
| <timeout></timeout>     | Integer type. The timeout value for the response to be outputted. If the FIN ACK of the       |
|                         | other peer is not received within <timeout>, the module will be forced to close the</timeout> |
|                         | socket. The range is 0-65535, and the default value is 0. Unit: second.                       |

#### 2.1.6. AT+QISTATE Query Socket Service Status

The command is used to query the socket service status. If the **<query\_type>** is 0, it will return the status of all existing socket services in the specified context. If the **<query\_type>** is 1, it will return the status of a specified socket service.

| AT+QISTATE Query Socket Service Status |          |
|--|----------|
| Test Command                           | Response |
| AT+QISTATE=?                           | ОК       |

| Read/Execution Command AT+QISTATE? or AT+QISTATE  | Response Return the status of all existing connections: +QISTATE: <connectid>,<service_type>,<ip_address>,<r emote_port="">,<local_port>,<socket_state>,<contextid>,<s erverid="">,<access_mode>,<at_port> []  OK</at_port></access_mode></s></contextid></socket_state></local_port></r></ip_address></service_type></connectid>                                 |
|---|---|
| Write Command  If <query_type> is 0, query the connection status of a specified context  AT+QISTATE=<query_type>,<context id=""></context></query_type></query_type>        | Response Return the status of all existing connections in a specified context: +QISTATE: <connectid>,<service_type>,<ip_address>,<remote_port>,<local_port>,<socket_state>,<contextid>,<serverid>,<access_mode>,<at_port> []  OK</at_port></access_mode></serverid></contextid></socket_state></local_port></remote_port></ip_address></service_type></connectid> |
| Write Command  If <query_type> is 1, query the connection status of a specified socket service  AT+QISTATE=<query_type>,<connect id=""></connect></query_type></query_type> | Response +QISTATE: <connectid>,<service_type>,<ip_address>,<r emote_port="">,<local_port>,<socket_state>,<contextid>,<s erverid="">,<access_mode>,<at_port>  OK</at_port></access_mode></s></contextid></socket_state></local_port></r></ip_address></service_type></connectid>   |

| <query_type></query_type>     | Integer type. The query type.   |   |
|-------------------------------|---|---|
|                               | 0 Query connection  | on status of all socket services in a specified context |
|                               | 1 Query connection  | on status of a specified socket service                 |
| <contextid></contextid>       | Integer type. The context ID. The range is 1-16.  |   |
| <connectid></connectid>       | Integer type. The socket service index. The range is 0-11.                                      |   |
| <service_type></service_type> | String type. The socket service type.   |   |
|                               | "TCP"   | Start a TCP connection as a client                      |
|                               | "UDP"   | Start a UDP connection as a client                      |
|                               | "TCP SERVICE"   | Start a TCP service                                     |
|                               | "TCP LISTENER"  | Start a TCP server to listen to TCP connection          |
|                               | "TCP INCOMING"  | Start a TCP connection accepted by a TCP server         |
|                               | "UDP SERVICE"   | Start a UDP service                                     |
|                               | "UDP LISTENER"  | Start a UDP server to listen to UDP connection          |
|                               | "UDP INCOMING"  | Start a UDP connection accepted by a UDP server         |
| <ip_address></ip_address>     | IP address.   |   |
|                               | If <b><service_type>=</service_type></b> "TCP" or "UDP", it is the IP address of remote server. |   |
|                               | If <service_type>="TCP LISTENER" or "UDP SERVICE", it is the local IP address.</service_type>   |   |

If <service\_type>="TCP INCOMING" or "UDP INCOMING", it is the IP address of

remote client.

<remote\_port> Remote port number.

If **<service\_type>=**"TCP" or "UDP", it is the port of remote server.

If <service\_type>="TCP LISTENER" or "UDP SERVICE", the port is invalid.

If <service\_type>="TCP INCOMING" or "UDP INCOMING", it is the port of remote

client.

Local port number.

If **<local\_port>** is 0, then the local port is assigned automatically.

<socket\_state> Integer type. The socket service status.

0 "Initial": connection has not been established

1 "Opening": client is connecting or server is trying to listen

2 "Connected": client/incoming connection has been established

3 "Listening": server is listening

4 "Closing": connection is closing

<serverID> It is valid only when <service\_type> is "TCP INCOMING". <serverID> represents

which server accepts this TCP incoming connection, and the value is the same as

<connectID> of this server's "TCP LISTENER".

<access\_mode> Data access mode.

Buffer access modeDirect push mode

2 Transparent access mode

**<AT\_port>** String type. COM port of socket service.

"usbmodem" USB modem port

"usbat" USB AT port

"uart1" UART port1

"cmux1" MUX port 1

"cmux2" MUX port 2

"cmux3" MUX port 3

"cmux4" MUX port 4

NOTE

"UDP LISTENER" of <service\_type> is only supported by EG95 and EG91 modules.

#### 2.1.7. AT+QISEND Send Data

If the data access mode of a specified socket service is buffer access mode (<access\_mode>=0) or direct push mode (<access\_mode>=1), then the data can be sent via this command. When the data is sent to the module successfully, SEND OK will be returned. Otherwise it will return SEND FAIL or ERROR. SEND FAIL indicates the sending buffer is full and the data can be tried to be resent. ERROR indicates it encounters an error in the process of sending data. The data should be delayed for some time

to be sent. The maximum data length is 1460 bytes. **SEND OK** does not mean the data has been sent to the server successfully. Customers can query whether the data has reached the server by **AT+QISEND=<connectID>,0** command.

| AT+QISEND Send Data  |  |
|--|--|
| Test Command AT+QISEND=?   | Response<br>+QISEND: (0-11),(0-1460)   |
|  | ок   |

#### **NOTE**

"UDP LISTENER" of **<service\_type>** is only supported by EG95 and EG91 modules.

#### 2.1.8. AT+QIRD Read the Received TCP/IP Data

In buffer access mode, after receiving data, the module will buffer it and report +QIURC: "recv",<connectID>, then the data can be read by AT+QIRD.

Please note that if the buffer is not empty, and the module receives data again, it will not report a new URC until all the received data has been read via **AT+QIRD** from buffer.

| AT+QIRD Read the Received TCP/IP Data   |   |

#### **NOTE**

"UDP LISTENER" of <service\_type> is only supported by EG95 and EG91 modules.

#### 2.1.9. AT+QISENDEX Send Hex String Data

This command is used to send hex string data and cannot be applied for "UDP SERVICE" and "TCP LISTENER" sockets.

| AT+QISENDEX Send Hex S | Send Hex String Data                         |  |
|------------------------|--|--|
| Test Command           | Response                                     |  |
| AT+QISENDEX=?          | +QISENDEX: (0-11), <hex_string></hex_string> |  |
|                        |  |  |
|                        | OK   |  |

| Write Command AT+QISENDEX= <connectid>,<h ex_string=""></h></connectid> | Response If the hex string is sent successfully: SEND OK |
|---|--|
|   | If the sending buffer is full: SEND FAIL                 |
|   | If the connection does not exist:  ERROR                 |

| <connectid></connectid>   | Integer type. The socket service index. The range is 0-11. |
|---------------------------|--|
| <hex_string></hex_string> | String type. Hex string data. The max length is 512 bytes. |

#### 2.1.10. AT+QISWTMD Switch Data Access Mode

The command can be used to switch the data access mode which includes buffer access mode, direct push mode and transparent access mode. When starting a socket service, the data access mode can be specified via the **<access\_mode>** parameter of **AT+QIOPEN**. After a socket has been opened, the data access mode can be changed via **AT+QISWTMD**.

| AT+QISWTMD Switch Data Acces   | ss Mode   |
|--|---|
| Test Command AT+QISWTMD=?  | Response<br>+QISWTMD: (0-11),(0-2)<br>OK  |
| Write Command AT+QISWTMD= <connectid>,<access _mode=""></access></connectid> | Response  If data access mode is switched successfully and <access_mode> is 0 or 1:  OK</access_mode>                             |
|  | If data access mode is switched successfully and <access_mode> is 2, the module will enter into data mode:  CONNECT</access_mode> |
|  | If there is any error:  ERROR   |

#### 2.1.11. AT+QPING Ping a Remote Server

The command is used to test the Internet protocol reachability of a host. Before using ping tools, the host should activate the context corresponding to **<contextID>** via **AT+QIACT** first. It will return the result within **<timeout>** and the default value of **<timeout>** is 4 seconds.

| AT+QPING Ping a Remote Serve  | Ping a Remote Server   |  |
|---|--|--|
| Test Command AT+QPING=?   | Response<br>+QPING: (1-16), <host>,(1-255),(1-10)</host>   |  |
| AITWI 1110=:  |  |  |
|   | OK   |  |
| Write Command   | Response   |  |
| AT+QPING= <contextid>,<host>[,<tim< th=""><th>If a remote server is pinged successfully:</th></tim<></host></contextid> | If a remote server is pinged successfully:   |  |
| eout>[, <pingnum>]]</pingnum>   | ОК   |  |
|   | LODING, wearly EdD address, three discountings   |  |
|   | [+QPING: <result>[,<ip_address>,<bytes>,<time>,<ttl>]<c<br>R&gt;<lf>]</lf></c<br></ttl></time></bytes></ip_address></result> |  |
|   |  |  |
|   | +QPING: <finresult>[,<sent>,<rcvd>,<lost>,<min>,<max>,</max></min></lost></rcvd></sent></finresult>                          |  |
|   | <avg>]</avg>   |  |
|   | If there is any error:   |  |
|   | ERROR  |  |

#### **Parameter**

| <contextid></contextid>   | Integer type. The context ID. The range is 1-16.                                      |  |
|---|---|--|
| <host></host>   | The host address in string type. The format is a domain name or a dotted decimal IP   |  |
|   | address.  |  |
| <timeout></timeout>   | Integer type. Set the maximum time to wait for the response of each ping request. The |  |
|   | range is 1-255, and the default value is 4. Unit: second.                             |  |
| <pre><pirple <p=""><pi style="font-size: 150%; color: blue;"></pi></pirple></pre> |   |  |
|   | 1-10, and the default value is 4.   |  |
| <result></result>   | The result of each ping request.  |  |
|   | 0 Received the ping response from the server. In this case, it is followed            |  |

|                           | by , <ip_address>,<bytes>,<time>,<ttl>.</ttl></time></bytes></ip_address>                                      |  |
|---------------------------|--|--|
|                           | Others Please refer to <i>Chapter 4</i> .  |  |
| <ip_address></ip_address> | The IP address of the remote server formatted as a dotted decimal IP.  |  |
| <bytes></bytes>           | The length of each sent ping request. Unit: byte.  |  |
| <time></time>             | The time wait for the response of the ping request. Unit: ms.  |  |
| <ttl></ttl>               | Time to live value of the response packet for the ping request.  |  |
| <finresult></finresult>   | The final result of the command.   |  |
|                           | 0 It is finished normally. It is successful to activate the context and find the host.                         |  |
|                           | In this case, it is followed by <sent>,<rcvd>,<lost>,<min>,<max>,<avg>.</avg></max></min></lost></rcvd></sent> |  |
|                           | Others Error codes. Please refer to <i>Chapter 4</i> for details.  |  |
| <sent></sent>             | Total number of the ping requests that have been sent.   |  |
| <rcvd></rcvd>             | Total number of the ping requests that received the response.  |  |
| <lost></lost>             | Total number of the ping requests that are time out.   |  |
| <min></min>               | The minimum response time. Unit: ms.   |  |
| <max></max>               | The maximum response time. Unit: ms.   |  |
| <avg></avg>               | The average response time. Unit: ms.   |  |

#### 2.1.12. AT+QNTP Synchronize Local Time with NTP Server

This command is used to synchronize the local time with Universal Time Coordinated (UTC) through the NTP server. Before time synchronization, the host should activate the context corresponding to **<contextID>** via **AT+QIACT** first. Depending on the network, it will take at most 125 seconds to return the result.

| AT+QNTP Synchronize Local Time with NTP Server     |   |
|--|---|
| Test command                                       | Response  |
| AT+QNTP=?  | +QNTP: (1-16), <server>,(list of supported <port>s),(0,1)</port></server> |
|  | ОК  |
| Read command                                       | Response  |
| AT+QNTP?   | If in the process of local time synchronization:                          |
|  | +QNTP: <server>,<port></port></server>                                    |
|  | ОК  |
| Write command                                      | Response  |
| AT+QNTP= <contextid>,<server></server></contextid> | If the local time is synchronized with NTP server successfully:           |
| [, <port>[,<autosettime>]]</autosettime></port>    | ОК  |
|  | +QNTP: <err>,<time></time></err>  |
|  | If there is any error:  |
|  | ERROR   |
| Maximum Response Time                              | 125s, determined by the network.  |

Integer type. The context ID. The range is 1-16. <contextID> String type. The address of NTP server. <server> <port> Integer type. The port of NTP server. The range is 1-65535. <autosettime> Integer type. Whether to automatically set synchronized time as local time. Not set 1 Set <err> Integer type. Error codes of the operation. Please refer to *Chapter 4* for details. String type. The time synchronized from NTP server. <time> The format is "YYYY/MM/DD,hh:mm:ss±zz". The range of zz is -48~+56.

#### 2.1.13. AT+QIDNSCFG Configure Address of DNS Server

Before setting the DNS address, the host must activate the context corresponding to **<contextID>** via **AT+QIACT** first.

| AT+QIDNSCFG Configure Address of DNS Server   |  |
|---|--|
| Test command  | Response   |
| AT+QIDNSCFG=?   | +QIDNSCFG: (1-16), <pridnsaddr>,<secdnsaddr></secdnsaddr></pridnsaddr>                 |
|   | ок   |
| Write Command   | Response   |
| AT+QIDNSCFG= <contextid>[,<pr< th=""><th>If <pri>pridnsaddr&gt; and <secdnsaddr> are omitted, query the</secdnsaddr></pri></th></pr<></contextid> | If <pri>pridnsaddr&gt; and <secdnsaddr> are omitted, query the</secdnsaddr></pri>      |
| idnsaddr>[, <secdnsaddr>]]</secdnsaddr>   | current DNS server addresses of a specified PDP context:                               |
|   | +QIDNSCFG: <contextid>,<pridnsaddr>,<secdnsaddr></secdnsaddr></pridnsaddr></contextid> |
|   | ок   |
|   | If <pri>pridnsaddr&gt; and <secdnsaddr> are present, configure the</secdnsaddr></pri>  |
|   | primary and secondary DNS server addresses of a specified PDP                          |
|   | context:   |
|   | ОК   |
|   |  |
|   | If there is any error:   |
|   | ERROR  |

#### **Parameter**

| <contextid></contextid>              | Integer type. The PDP context ID. The range is 1-16. |
|--------------------------------------|--|
| <pre><pridnsaddr></pridnsaddr></pre> | String type. The primary DNS server address.         |
| <secdnsaddr></secdnsaddr>            | String type. The secondary DNS server address.       |

#### 2.1.14. AT+QIDNSGIP Get IP Address by Domain Name

Before querying the DNS, the host should activate the context corresponding to **<contextID>** via **AT+QIACT** first. Depending on the network, it will take at most 60 seconds to return the result.

| AT+QIDNSGIP Get IP Address  | ss by Domain Name   |
|---|---|
| Test Command  | Response  |
| AT+QIDNSGIP=?   | +QIDNSGIP: (1-16), <hostname></hostname>                                |
|   |   |
|   | ОК  |
| Write Command   | Response  |
| AT+QIDNSGIP= <contextid>,<hos< td=""><td>OK</td></hos<></contextid> | OK  |
| tname>  |   |
|   | If there is any error:  |
|   | ERROR   |
|   |   |
|   | The result will be returned as URC.                                     |
|   | +QIURC: "dnsgip", <err>,<ip_count>,<dns_ttl></dns_ttl></ip_count></err> |
|   | [   |
|   | +QIURC: "dnsgip", <hostlpaddr>]</hostlpaddr>                            |
| Maximum Response Time   | 60s, determined by the network.   |

#### **Parameter**

| <contextid></contextid>   | Integer type. The PDP context ID. The range is 1-16.                                     |
|---------------------------|--|
| <hostname></hostname>     | String type. The domain name.  |
| <err></err>               | Integer type. Error codes of the operation. Please refer to Chapter 4.                   |
| <ip_count></ip_count>     | Integer type. The number of the IP addresses corresponding to the <hostname>.</hostname> |
| <dns_ttl></dns_ttl>       | Integer type. The time to live of the DNS.   |
| <hostlpaddr></hostlpaddr> | String type. The IP address of <hostname>.</hostname>                                    |

#### 2.1.15. AT+QICFG Configure Optional Parameters

The command is used to configure optional parameters.

| AT+QICFG Configure Optional Parameters |  |
|--|--|
| Test Command                           | Response                                 |

|  | 1 Enable corresponding function   |  |  |
| <idle_time></idle_time>  | Integer type. Indicates the cycle time of keepalive triggered, the range is                         |  |  |
|  | 1-120, Unit: min  |  |  |
| <interval_time></interval_time>  | Integer type. Indicates the interval of send a packet in a cycle time, the                          |  |  |
| _  | range is 25-100, Unit: seconds.   |  |  |
| <pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre> | Integer type. Indicates the cnt of packet send in a cycle time, the range is                        |  |  |
|  | 3-10.   |  |  |
| <recv_buffersize></recv_buffersize>  | Integer type. The recv buffer size of TCPIP, the range is 10240- 524288, and                        |  |  |
|  | the default is 10240, Unit: bytes.  |  |  |

#### **NOTE**

The setting of AT+QICFG="tcp/retranscfg"[,<max\_backoffs>,<max\_rto>] will take effect to all TCP sockets and cannot be saved to NV.

#### 2.1.16. AT+QISDE Control Whether to Echo the Data for AT+QISEND

This command is used to control whether to echo the data for AT+QISEND

| AT+QISDE Control Whether to Echo the Data for AT+QISEND |                        |
|---|------------------------|
| Test command AT+QISDE=?                                 | Response               |
| AI+QISDE=!  | +QISDE: (0,1)          |
|   | ОК                     |
| Read command  | Response               |
| AT+QISDE?   | +QISDE: <echo></echo>  |
|   |                        |
|   | OK                     |
| Write Command   | Response               |
| AT+QISDE= <echo></echo>                                 | ок                     |
|   |                        |
|   | If there is any error: |
|   | ERROR                  |

#### **Parameter**

| <echo></echo> | Numeric type. Whether to echo the data for AT+QISEND |                   |
|---------------|--|-------------------|
|               | 0  | Not echo the data |
|               | <u>1</u>   | Echo the data     |

#### 2.1.17. AT+QIGETERROR Query the Last Error Code

If **ERROR** is returned after executing TCP/IP commands, the details of error can be queried via **AT+QIGETERROR**. Please note that **AT+QIGETERROR** just returns error code of the last TCP/IP AT command.

| AT+QIGETERROR Query the Las     | t Error Code  |
|---------------------------------|---|
| Test command  AT+QIGETERROR=?   | Response <b>OK</b>  |
| Execution Command AT+QIGETERROR | Response +QIGETERROR: <err>,<errcode_description></errcode_description></err> |
|                                 | ок  |

| <err></err>  | Integer type.Error codes of the operation. Please refer to <i>Chapter 4</i> .  |  |
|--|--|--|
| <pre><errcode_description></errcode_description></pre> | A string parameter indicates the details of error information. Please refer to |  |
|  | Chapter 4 for details.   |  |

#### 2.2. Description of URCs

The URC of TCP/IP AT commands will be reported to the host in the format of beginning with **+QIURC**:. It contains the reports about incoming data, connection closed and incoming connection and so on. Actually, there is **<CR><LF>** both before and after URC, but **<CR><LF>** is not presented intentionally.

#### 2.2.1. URC Indicating Connection Closed

When TCP socket service is closed by remote peer or due to network error, the URC will be outputted, and the status of socket service will be "closing" (<socket\_state>=4). AT+QICLOSE=<connectID> can be used to change the <socket\_state> to initial.

#### **URC Indicating Connection Closed**

| +QIURC: "closed", <connectid> Socket service connection is closed.</connectid> |  |
|--|--|
|--|--|

#### **Parameter**

| <connectid></connectid> | Integer type. The socket service index. The range is 0-11. |
|-------------------------|--|
|-------------------------|--|

#### 2.2.2. URC Indicating Incoming Data

In buffer access mode or direct push mode, after receiving data, the module will report a URC to the host.

In buffer access mode, after receiving data, the module will report URC as **+QIURC**: "recv",<connectID> to notify the host. Then host can retrieve data via **AT+QIRD**. Please note that if the buffer is not empty, and the module receives data again, it will not report a new URC until all the received data has been retrieved via **AT+QIRD** from buffer.

In direct push mode, the received data will be outputted to COM port directly.

| URC Indicating Incoming Data            |   |
|---|---|
| +QIURC: "recv", <connectid></connectid> | The URC indicates the incoming data in buffer access mode. The host can receive data via <b>AT+QIRD</b> . |
|   | THE HOST CAN receive data via ATTOIND.  |

| +QIURC:   | The URC indicates the incoming data in direct push mode                       |
|---|---|
| "recv", <connectid>,<currentrecvleng< th=""><th>when the <b><service_type></service_type></b> is "TCP", "UDP", "UPD INCOMING"</th></currentrecvleng<></connectid> | when the <b><service_type></service_type></b> is "TCP", "UDP", "UPD INCOMING" |
| th> <cr><lf><data></data></lf></cr>   | or "TCP INCOMING".  |
| +QIURC:   | The URC indicates data incoming in direct push mode when                      |
| "recv", <connectid>,<currentrecvleng< th=""><th><pre><service_type> is "UDP SERVICE".</service_type></pre></th></currentrecvleng<></connectid>                    | <pre><service_type> is "UDP SERVICE".</service_type></pre>                    |
| th>, <remoteip>,<remote_port><cr>&lt;</cr></remote_port></remoteip>   |   |
| LF> <data></data>   |   |

**<connectID>** Integer type. The socket service index. The range is 0-11.

**<currentrecvlength>** Integer type. The length of actually received data.

<remoteIP> Remote IP address.

<remote\_port> Remote port.
<data> The received data.

#### 2.2.3. URC Indicating Incoming Connection Full

If the incoming connection reaches the limit, or no socket system resources can be allocated, then the module will report the URC as **+QIURC**: "incoming full" for the new incoming connection request.

#### **URC Indicating Incoming Connection Full**

**+QIURC:** "incoming full" The URC indicates the incoming connection is full.

**NOTE** 

"UDP LISTENER" of <service\_type> is only supported by EG95 and EG91 modules.

#### 2.2.4. URC Indicating Incoming Connection

If the <service\_type> is "TCP LISTENER" or "UDP LISTENER", when a remote client connects to this server, the host will automatically assign a free <connectID> for the new connection. The range of <connectID> is 0-11. In such a case, the module will report the URC. The <service\_type> of the new connection will be "TCP INCOMING", and the <access\_mode> will be buffer access mode.

#### **URC of Incoming Connection**

+QIURC: "incoming",<connectID>,<s erverID>,<remoteIP>,<remote\_port> When the new incoming connection is accepted by **<serverID>**, the allocated **<connectID>**, **<remoteIP>** and **<remote\_port>** will be informed by this URC.

| <connectid></connectid>     | Integer type. Assign this socket service for the incoming connection, which is  |  |
|-----------------------------|---|--|
|                             | automatically specified by the module. The range is 0-11.   |  |
| <serverid></serverid>       | The incoming <b><connectid></connectid></b> accepted by the server whose <b><service_type></service_type></b> is "TCP |  |
|                             | LISTENER" or "UDP LISTENER" and listening socket ID is <serverid>.</serverid>   |  |
| <remotelp></remotelp>       | Remote IP address of the incoming <b><connectid></connectid></b> .  |  |
| <remote_port></remote_port> | Remote port of the incoming <b><connectid></connectid></b> .  |  |

#### **NOTE**

"UDP LISTENER" of <service\_type> is only supported by EG95 and EG91 modules.

#### 2.2.5. URC Indicating PDP Deactivation

PDP context may be deactivated by the network. The module will report the URC to the host about PDP deactivation. In such a case, the host must execute **AT+QIDEACT** to deactivate the context and reset all connections.

#### **URC of PDP Deactivation**

| +QIURC: "pdpdeact", <contextid></contextid> | <contextid> context is deactivated.</contextid> |
|---|---|

#### **Parameter**

<contextID> Integer type. The context ID. The range is 1-16.

# 3 Examples

#### 3.1. Configure and Activate a Context

#### 3.1.1. Configure a Context

| AT+QICSGP=1,1,"UNINET","",1 | //Configure context 1. APN is "UNINET" for China Unicom. |
|-----------------------------|--|
| OK                          |  |

#### 3.1.2. Activate a Context

| AT+QIACT=1                 | //Activate context 1. Depending on the network, the maximum response time is 150s. |
|----------------------------|--|
| ОК                         | //Activated the context successfully.  |
| AT+QIACT?                  | //Query the context state.   |
| +QIACT: 1,1,1,"10.7.157.1" |  |
|                            |  |
| OK                         |  |

#### 3.1.3. Deactivate a Context

| AT+QIDEACT=1 | //Deactivate context 1.                                  |  |
|--------------|--|--|
| ОК           | //Deactivated the context successfully. Depending on the |  |
|              | network, the maximum response time is 40s.               |  |

#### 3.2. TCP Client Works in Buffer Access Mode

#### 3.2.1. Set up a TCP Client Connection and Enter into Buffer Access Mode

| AT+QIOPEN=1,0,"TCP","220.180.239.212",8009,0,0 | //Context is 1 and <b><connectid></connectid></b> is 0. Before |
|--|--|
|  | using AT+QIOPEN, the host should activate                      |
|  | the context with AT+QIACT first.                               |
| ОК   |  |

+QIOPEN: 0,0

//TCP client is connected successfully. It is suggested to wait for 150 seconds for the URC response as +QIOPEN: <connectID>,<err>. If the URC response cannot be received in 150 seconds, the host could use AT+QICLOSE to close the socket.

AT+QISTATE=1,0

//Query the connection status of socket service 1.
+QISTATE: 0,"TCP","220.180.239.201",8009,65514,2,1,0,0,"usbmodem"

## 3.2.2. Send Data in Buffer Access Mode

AT+QISEND=0 //Send variable-length data.

> test1<ctrl+Z>

SEND OK //SEND OK does not mean the data has been sent to the server

successfully. The host can query whether the data has reached the

server via AT+QISEND=0,0.

AT+QISEND=0,4 //Send fixed-length data and the data length is 4 bytes.

> test

OK

**SEND OK** 

AT+QISEND=0,0 //Query the length of sent data.

+QISEND: 9,9,0

OK

AT+QISENDEX=0,"3132333435" //Send Hex string data.

**SEND OK** 

AT+QISEND=0,0 //Query the length of sent data, acknowledged data and

unacknowledged data.

+QISEND: 14,14,0

OK

#### 3.2.3. Receive Data from Remote Server in Buffer Access Mode

**+QIURC:** "recv",0 //The received data when **<connectID>=**0.

AT+QIRD=0,1500 //Read data, the maximum length of data to be retrieved is 1500 bytes.

**+QIRD: 5** //The length of actually received data is 5 bytes.

test1

OK

AT+QICFG="recvind",1

OK

+QIURC: "recv",0,5 //The <connectID>= 0 received 5 bytes data.

AT+QIRD=0,1500 //Read data, and the length is 1500 bytes.

+QIRD: 5 //The length of actual received data is 5 bytes.

test1

OK

AT+QIRD=0,1500

**+QIRD: 0** //No data in buffer.

OK

AT+QIRD=0,0 //Query the total length of received data, including read and unread data.

+QIRD: 10,10,0

OK

#### 3.2.4. Close a Connection

AT+QICLOSE=0 //Close a connection whose <connectID> is 0. Depending on the network, the maximum response time is 10s.

OK

## 3.3. TCP Client Works in Transparent Access Mode

## 3.3.1. Set up a TCP Client Connection and Enter into Transparent Access Mode

AT+QIOPEN=1,0,"TCP","220.180.239.212",8009,0,2 //Context is 1 and <connectID> is 0. Before using AT+QIOPEN, the host should activate the context with AT+QIACT first.

CONNECT //TCP client is connected successfully. It is suggested to wait for 150 seconds for the URC response as CONNECT. If the URC response cannot be received in 150 seconds, the host could use AT+QICLOSE to close the socket.

## 3.3.2. Send Data in Transparent Access Mode

<All data got from COM port will be sent to internet directly>

## 3.3.3. Receive Data from Remote Server in Transparent Access Mode

| Test 1 | //All data received from internet will be outputted via |
|--------|---|
|        | COM port directly.                                      |

#### 3.3.4. Close a TCP Client

| AT+QICLOSE=0 | //After using +++ to exit from the transparent access |
|--------------|---|
|              | mode, the host could use AT+QICLOSE to close the      |
|              | TCP link. Depending on the network, the maximum       |
|              | response time is 10s.                                 |
| OK           |   |

## 3.4. TCP Client Works in Direct Push Mode

## 3.4.1. Set up a TCP Client Connection and Enter into Direct Push Mode

| AT+QIOPEN=1,0,"TCP","220.180.239.212",8009,0  | ,1 //Context is 1 and <connectid> is 0. Before using AT+QIOPEN, the host should activate the context via AT+QIACT first.</connectid>  |
|---|---|
| ОК  |   |
| +QIOPEN: 0,0                                  | //TCP client is connected successfully. It is suggested to wait for 150 seconds for the URC response as +QIOPEN: <connectid>,<err>. If the URC response cannot be received in 150 seconds, the host could use AT+QICLOSE to close the socket.</err></connectid> |
| AT+QISTATE=1,0                                | //Query if the connection state of <b><connectid></connectid></b> is  |
| +QISTATE: 0,"TCP","220.180.239.201",8009,6534 | 0.<br><b>4,2,1,0,1,"usbmodem"</b>   |
| ОК  |   |

## 3.4.2. Send Data in Direct Push Mode

| AT+QISEND=0<br>> test1 <ctrl+z></ctrl+z> | //Send variable-length data.   |
|--|--|
| SEND OK                                  | //SEND OK does not mean the data has been sent to the server successfully. Host can query whether the data has reached the server via AT+QISEND=0,0. |
| AT+QISEND=0,5 > test2                    | //Send fixed length data and the data length is 5 bytes.   |
| SEND OK                                  |  |
| AT+QISEND=0,0                            | //Query the length of sent data, acknowledged data and unacknowledged data.  |
| +QISEND: 10,10,0                         |  |
| ОК                                       |  |

## 3.4.3. Receive Data from Remote Server in Direct Push Mode

| +QIURC: "recv",0,4 | //Receive data from remote server. |
|--------------------|------------------------------------|
| test               |                                    |

## 3.4.4. Close a TCP Client

| AT+QICLOSE=0 | //Close the connection whose <b><connectid></connectid></b> is 0. |
|--------------|---|
|              | Depending on the network, the maximum response time               |
|              | is 10s.   |
| OK           |   |

## 3.5. TCP Server Works in Buffer Access Mode

## 3.5.1. Start a TCP Server

| AT+QIOPEN=1,1,"TCP LISTENER","127.0.0.1",0,2020,0 //Context is 1 and <connectid> is 1. Before</connectid> |   |
|---|---|
|   | using AT+QIOPEN, the host should          |
|   | activate the context with AT+QIACT first. |
| ОК  |   |
|   |   |
| +QIOPEN: 1,0  | //TCP server is opened successfully.      |
| AT+QISTATE=0,1  | //Query whether the connection state of   |

## 3.5.2. Accept TCP Incoming Connection

**+QIURC:** "incoming",11,1,"172.31.242.222",54091 //Accept a TCP connection. The **<service\_type>** is "TCP incoming", and **<connectID>** is 11.

## 3.5.3. Receive Data from Incoming Connection

| +QIURC: "recv",11 | //Receive data from remote incoming connection.      |
|-------------------|--|
| AT+QIRD=11,1500   | //Read data received from incoming connection.       |
| +QIRD: 4          | //Actual data length is 4 bytes.                     |
| test              |  |
|                   |  |
| OK                |  |
| AT+QIRD=11,1500   |  |
| +QIRD: 0          | //No data in buffer.                                 |
|                   |  |
| OK                |  |
| AT+QIRD=11,0      | //Query the total length of received data, including |
|                   | read and unread data.                                |
| +QIRD: 4,4,0      |  |
|                   |  |
| ОК                |  |

## 3.5.4. Close a TCP Server

| AT+QICLOSE=11 | //Close the incoming connection. Depending on  |
|---------------|--|
|               | the network, the maximum response time is 10s. |
| ОК            |  |
| AT+QICLOSE=1  | //Close TCP server listening.                  |
| OK            |  |

## 3.6. Example of UDP Service

#### 3.6.1. Start a UDP Service

AT+QIOPEN=1,2,"UDP SERVICE","127.0.0.1",0,3030,0 //Start a UDP service. The <connectID> is 2 and <contextID> is 1. Before using AT+QIOPEN, the host should activate the context with AT+QIACT first. OK //UDP service is opened successfully. +QIOPEN: 2,0 //Query if the connection status of <contextID> AT+QISTATE=0,1 +QISTATE: 2,"UDP SERVICE","10.7.157.1",0,3030,2,1,2,0,"usbmodem" OK

#### 3.6.2. Send UDP Data to Remote

| AT+QISEND=2,10,"10.7.89.10",6969 | //Send 10 bytes data to remote whose IP is |
|----------------------------------|--|
|                                  | 10.7.89.10 and the remote port is 6969.    |
| >1234567890                      |  |
| SEND OK                          |  |

## 3.6.3. Receive Data from Remote

| //Receive data from remote.  //Read UDP data. One whole UDP packet will be outputted. There is no need to specify the read length. |
|--|
| //Data length is 4. The remote IP address is 10.7.76.34 and remote port is 7687.   |
|  |
|  |
| //Read data.   |
| //No data in buffer.   |
|  |
| //Send data to the remote whose IP is 10.7.76.34 and remote port is 7687.  |
|  |

>1234567890 SEND OK

#### 3.6.4. Close a UDP Service

AT+QICLOSE=2

//Close the service.

OK

## **3.7. PING**

AT+QPING=1,"www.baidu.com"

//Ping <a href="www.baidu.com">www.baidu.com</a> in context 1. Before pinging the destination IP address, the host should activate

the context by AT+QIACT first.

OK

+QPING: 0,"61.135.169.125",32,192,255

+QPING: 0,"61.135.169.125",32,240,255

+QPING: 0,"61.135.169.125",32,241,255

+QPING: 0,"61.135.169.125",32,479,255

+QPING: 0,4,4,0,192,479,287

## 3.8. Synchronize Local Time

AT+QNTP=1,"202.112.10.36",123

//Synchronize local time with NTP server "202.112.10.36:123". Before synchronizing the time, the host should activate the context with

AT+QIACT first.

OK

+QNTP: 0,"2019/07/21,06:10:59+00"

AT+CCLK?

+CCLK: "19/07/21,06:11:05+00"

OK

## 3.9. Get Last Error Code

AT+QIOPEN=1,"TCP","220.180.239.212",8009,0,1 //Start a socket service, and <connectID> is not specified.

**ERROR** 

AT+QIGETERROR

+QIGETERROR: 552, invalid parameters

OK

## 4 Summary of Error Codes

If an **ERROR** is returned after executing TCP/IP AT commands, the details of error can be queried via **AT+QIGETERROR**. Please note that **AT+QIGETERROR** just returns error code of the last TCP/IP AT command.

**Table 1: Summary of Error Codes** 

| <err></err> | Meaning                       |
|-------------|-------------------------------|
| 0           | Operation successful          |
| 550         | Unknown error                 |
| 551         | Operation blocked             |
| 552         | Invalid parameters            |
| 553         | Memory not enough             |
| 554         | Create socket failed          |
| 555         | Operation not supported       |
| 556         | Socket bind failed            |
| 557         | Socket listen failed          |
| 558         | Socket write failed           |
| 559         | Socket read failed            |
| 560         | Socket accept failed          |
| 561         | Open PDP context failed       |
| 562         | Close PDP context failed      |
| 563         | Socket identity has been used |
| 564         | DNS busy                      |

| 565 DNS parse failed  566 Socket connect failed  567 Socket has been closed  568 Operation busy  569 Operation timeout  570 PDP context broken down  571 Cancel send  572 Operation not allowed  573 APN not configured  574 Port busy |     |                         |
|--|-----|-------------------------|
| 567 Socket has been closed  568 Operation busy  569 Operation timeout  570 PDP context broken down  571 Cancel send  572 Operation not allowed  573 APN not configured   | 565 | DNS parse failed        |
| 568 Operation busy  569 Operation timeout  570 PDP context broken down  571 Cancel send  572 Operation not allowed  573 APN not configured   | 566 | Socket connect failed   |

| 570 PDP context broken down  571 Cancel send  572 Operation not allowed  573 APN not configured  | 568 | Operation busy          |
| 571 Cancel send 572 Operation not allowed 573 APN not configured   | 569 | Operation timeout       |
| 572 Operation not allowed 573 APN not configured   | 570 | PDP context broken down |
| 573 APN not configured   | 571 | Cancel send             |
|  | 572 | Operation not allowed   |
| 574 Port busy  | 573 | APN not configured      |
|  | 574 | Port busy               |

# 5 Appendix A Reference

**Table 2: Terms and Abbreviations** 

| Abbreviation | Description  |
|--------------|--|
| 3GPP         | 3rd Generation Partnership Project                 |
| ACK          | Acknowledge  |
| APN          | Access Point Name                                  |
| ASCII        | American Standard Code for Information Interchange |
| CHAP         | Challenge Handshake Authentication Protocol        |
| CS           | Circuit Switching                                  |
| DNS          | Domain Name System                                 |
| FIN          | Finish   |
| ID           | Identify   |
| IP           | Internet Protocol                                  |
| NTP          | Network Time Protocol                              |
| NV           | Non-Volatile                                       |
| PAP          | Password Authentication Protocol I                 |
| PDP          | Packet Data Protocol                               |
| PPP          | Point-to-Point Protocol                            |
| PS           | Packet Switching                                   |
| QoS          | Quality of Service                                 |
| TCP          | Transmission Control Protocol                      |
| TCP/IP       | Transmission Control Protocol/Internet Protocol    |
| UART         | Universal Asynchronous Receiver& Transmitter       |

| UDP    | User Datagram Protocol                 |
|--------|--|
| URC    | Unsolicited Result Code                |
| USB    | Universal Serial Bus                   |
| (U)SIM | (Universal) Subscriber Identity Module |
| UTC    | Coordinated Universal Time             |
